1. Does AutoCAD have a GUI? AutoCAD has a GUI - user interface. What this means is that if you want to draw on the screen, you can simply right click and pull up the "Edit" context menu, where you can select the "Tool Palette", select "Drawing Tools" and then select the "Line" tool. The GUI is quite simple and there are very few options available. However, if you want to customize the tool palette, you can go into the "Settings" option, which is located at the bottom of the "Tools" dialog. The "Settings" dialog gives you a choice of more than two dozen tool palettes which can be added to the "Tools" context menu. The tool palettes are very easy to use. There is an "About" option, which shows you all of the current tools available for drawing, etc. There is also a "Help" option which will give you very detailed instructions about using AutoCAD. The two tool palettes that are most useful for drawing include the "Dynamics" tool palette, which has only five basic drawing tools. And the "Architectural" tool palette, which has 23 basic drawing tools. So if you can get into the habit of using one of these two tool palettes, you will never have to use the basic "Draw" tool, which is not too difficult to use but which has very limited functionality. 2. How do you import a drawing? Before you can actually create a drawing, you have to import a drawing from another source. This is done by using the "Import" option of the "File" menu. Select the file you want to import (such as a DWG, DXF, etc) and then choose the "Import" option from the "File" menu. If you have previously imported this file in AutoCAD, it will open automatically. If it is a new file, the import dialog will appear with a list of available formats and you can choose the format you wish to import (e.g. DWG, DXF, etc). 3. How do you save a drawing? Saving a drawing is a very easy process. Select the "File" menu, select the "Save" option and then select the type of drawing that you want to save (e.g. DWG, DXF, etc). This will open a dialog where

CAD models CAD files contain the definition of a model, consisting of a set of geometric entities, referred to as drawing elements, arranged in a hierarchically ordered graph of reference frames, with a top-level view called a drawing. Models can be created in CAD software using a variety of methods, including using parametric tools to create parts of the model, or drawing freehand with a mouse or drawing tablet. Any geometric entity that is editable in the CAD application is modeled by definition.

For example, some CAD applications use the term "entity" to refer to a polyline, arc, circle, or spline. A model is the representation of the entity within the context of a drawing. A model's drawing is the representation of the model as a combination of geometric entities and their attributes. In general, models are limited to having a single drawing in which they are defined and related to other objects, which are a subset of the geometric entities contained within the drawing. Typically, the model contains a set of entities called "geometries" or "geometry", which are used to represent the entities in the drawing. For example, a circle is a geometry, and its representation might be a line, an ellipse, a bezier curve, or any other path. Similarly, a line segment is a geometry, and its representation might be a line, a spline, or a polyline. The term "block" is also used in CAD to refer to a single graphical representation of a mathematical element. For example, a circle, or ellipse, is represented by a block. Block types are used to represent the different types of geometry in CAD. The available block types in AutoCAD depend

on the object type and shape being modeled, and the geometric operations that may be applied. For example, two blocks may be linked together to represent a spline or a solid. Similarly, blocks may be stacked together to create a wall or pipe, or filled with a common color to create a part. The representation of a block may be a solid or a wireframe, depending on the type of block. In

general, any two blocks of the same type in the same drawing, that have the same reference coordinates, have the same reference geometry. Two blocks that are not linked together, such as walls and pipes, may have a different reference geometry. Blocks that are stacked together have a shared reference, which may be the same, but only if they share reference coordinates.
