What's New In SW Weather?

This free application is Java-based and, therefore, requires Java to be installed on your computer. It was built for Windows operating systems. The small, simple-looking application simply requests the user to enter his city and state and displays the time, current temperature and the weather forecast for the next few days. The installation package also contains a link to a brief manual that includes a troubleshooting guide. What we liked: It has an intuitive and easy-to-use user interface. It offers multiple locations to search. It works with the web browser. What we didn't like: It doesn't include interactive features and you can't schedule temperature alerts. We would like to hear your opinion. Have you ever used this tool? If so, what do you like most about it? If not, what do you

dislike about it? SW Weather is a Java-based software application that facilitates a quick method for monitoring weather conditions in any geographical location, by simply entering a zip code. It contains just a few options which are intuitive enough to be figured out by all types of users. Java-based tool with a simple GUI This tool required Java to run. It's packed in a single executable Jar file that you can save in a custom location on the disk and double-click it to launch the program. It can also be saved to a removable storage unit to run it on any PC with Java. Unlike most installers, it doesn't make any changes to the Windows registry. View the weather forecast As far as the interface is concerned, SW Weather adopts a small window with a plain-looking structure. It's evident that the utility doesn't put emphasis on the graphical elements of the GUI, yet it's easy to navigate. It runs from the systray and gets minimized to the systray on close. To get started, it's necessary to enter the zip code of a geographical location. This triggers the application to show the local time (in the 12-clock format), the current temperature (in Celsius), as well as the one of the following night and day. This information can be refreshed. Evaluation and conclusion The program didn't put a strain on the system's performance in our tests, thanks to the fact that it needed a low amount of CPU and RAM to work properly. No error dialogs popped up and it didn't hang or crash. On the other hand, SW Weather hasn't been updated for a long and it's likely to experience compatibility issues with newer Windows

System Requirements For SW Weather:

Windows 10 or 8.1 Processor: i3-2100T 2.0 GHz (6 cores) or higher
Memory: 6 GB RAM Video: NVidia GTX 970 (3GB or more) or AMD R9 290 or higher (4GB or more) Mouse: 1-button Keyboard: 1-button
Additional Notes: No keys detected on Windows 10 users. Please, delete all existing settings under "User Accounts" -> "My account" -> "Setting" -> "Control Panel"
