With any image editing tool, your skills and the skills of those around you help determine the effectiveness and usefulness of your images. I've seen photographers create some impressive images and share them with the community, but then others edit them to trash their work. If the room where you are shooting is too noisy or is full of distracting conversation, it becomes more difficult to create truly sharp images. Creating a document To start Photoshop, click the Photoshop icon on the Windows taskbar, or choose File⇒New and then click the Open button, and the program opens as shown in Figure 13-8. When you first open a document, it's displayed with the default size of 3 x 3 inches. When you save this document, you may want to resize it to a larger size so it fits your needs, or you may want to resize it later. FIGURE 13-8: To start working on an image, you have the option of starting a new document or opening an existing one. Importing an image Creating a new document with Photoshop is a fast way to begin your digital photo projects. However, if you have a photo that you want to edit, you can import it into a new file and then begin editing. To import a photo, follow these steps: 1. Browse to the location of the photo or video on your computer and select the file. Your files may be stored in any of the places listed on your computer, including: Windows: My Computer Mac: Desktop or Pictures folder Mac: Recently Added or iPhoto Library 2. Click Open. You see a thumbnail of your image displayed. 3. Choose Edit⇒Actions⇒Edit in. Figure 13-9 shows the Edit in dialog box. 4. Choose the Edit Imported Photos and Video option. The dialog box displays your image's filenames and the location where you imported it. Photoshop still displays the original image but resizes it to fit the new document. The new size of the imported image appears in the lower-right corner of the program. FIGURE 13-9: You can import your image immediately to start editing. Creating a document from an image You can work with an image in Photoshop without importing it first. To create a new document from an image, follow these steps: 1. Open the image

Today, we'll look at how to identify and report problems with our own code base via a feature in the product called the Feedback Response Tool. How does the Feedback Response Tool work? Let's start by looking at the most basic way you report issues with code in vSphere: You can use the "Submit Feedback" link on the "Manage Feedback" page found on any vSphere 6.5 site. The product goes out of it's way to direct you to the vSphere 6.5 documentation site to get the most up to date documentation on any given topic. Q: linker errors on xcode 6 and objective C class extensions I have a storyboard, a controller extension, and a view controller extension. I'm following this tutorial - - and the project builds fine in xcode 6.0.4, but it doesn't build in xcode 6.1 beta 4. It was building fine in xcode 6.0.4, but after I build in 6.1 beta 4, it throws an error on the first line of viewDidLoad(). The error shows up as: 'UIApplicationMain' was not found in the current project I'm trying to link my view controller extension to my storyboard view controller. I've made sure that the UIViewController extension to storyboard is set to none. Thanks for any help! Note: I've tried deleting the storyboard from the project and re-adding it. I've also tried using the older versions of the extensions - the class extension and the storyboard-based extension. A: I just had this same problem. I was having to load

a different class file because I had a class that was in a header file, but it wasn't being loaded in the View Controller Extension. I was on Swift 1.2 and I fixed this by using: @objc(YourViewControllerClassName) open class YourViewControllerClassName {} In my View Controller Extension file instead of this: open class YourViewControllerClassName { @IBAction func doSomething(sender: AnyObject) {} } And then in the View Controller file I would use MyViewControllerClassName instead. For example: open class MyViewControllerClassName { @IBAction func doSomething(sender: AnyObject) {} } Q: Documentation links in Eclipse Error Log Is there any way to link documentation in errors (not only in Eclipse in which they show where the error has come from)? For example, when this problem happens: java.lang.NullPointerException at com.javacodegeeks.blog.SplashScreen.onDraw(SplashScreen.java:28) I want to
