AutoCAD architecture AutoCAD design data is stored in a design database. The design database is composed of several files, which includes one or more color palettes, fonts, standards and models. The design database is accessed by the graphics driver which is provided by Autodesk. The graphics driver is usually embedded in the operating system. AutoCAD uses a graphics stack which is composed of a set of software layers. This includes a device driver which is responsible for controlling the hardware and software components of the graphics stack. The device driver communicates with the operating system, which is also responsible for handling the tasks such as device file management, threads, threads and more. The operating system is composed of many other layers including: Hardware Hardware is not directly involved in AutoCAD rendering process. The main purpose of hardware is to provide the platform on which the operating system operates. Hardware is essential for storing the AutoCAD file and design database. It also connects the user with the monitor, keyboard and mouse. Display Display is an output device which is used for displaying information on the monitor or paper. Display is composed

of the following layers: Display driver As mentioned earlier, the display driver is responsible for storing the AutoCAD file and the design database. It also handles the task of displaying the graphics. It is usually embedded in the operating system. The graphics driver communicates with the AutoCAD application layer and the device driver through the graphics API. Device A device is a device driver which is responsible for connecting the graphics driver to the display. Examples of devices are: Monitor Mouse Keyboard Wireless access point Printer Ethernet switch A. Device driver architecture A device driver is a software program which enables the computer to communicate with a hardware device. Devices are classified as input and output devices. Output devices are used to display information, whereas input devices are used to collect information. Both the input and output devices are connected to the device driver. Input devices include: Video Audio Keyboard Mouse To understand the design and how it is implemented in AutoCAD, it is essential to understand the hardware abstraction layer which is used to communicate with the device driver. B. Graphics driver architecture The graphics driver is responsible for communicating with the device driver. It is also responsible for presenting the AutoCAD content

Migrate layers: Save yourself hours of tedious work. With the brand new AutoCAD 2023, you can easily merge, split, and move layers from one drawing to another, or from one drawing to another drawing in an entirely different application. No more copying and pasting. (video: 1:40 min.) **Collaboration with external content:** Create diagrams using non-AutoCAD applications, such as PowerBI, and easily import them into AutoCAD. (video: 1:42 min.) **Create custom workspaces:** Get the most out of your current environment by creating multiple workspaces. Set up workspaces by simply selecting a predefined section
