designed to save you  
time performing  
statistical tests.

Let's see an  
example: What is the  
result of a  
Student's T-Test  
with  $\alpha=5\%$  = pvalue  
0.15 With this  
application, you  
only need to enter  
the name of the

---

test, mean, standard deviation, sample size and name of the dependent variable and the program is done. Robostat is very easy to use and very helpful since it creates a summary of the test for you with absolute values. No more data entry by yourself. Simpler and faster than hand calculation.

Robostat FAQ: - Is Robostat a standalone program or must it be installed with the original Statistics?

No, Robostat is a program that you can download from and is an independent program. - What is the sample size? The sample size is the size of the sample that is given to the test. - What is the

---

standard deviation?

The standard deviation is the value of the distribution that determines the size of the interval in which the data has a 50% chance of falling. - Which values can I use for the sample size? The sample size can be: 10 20 50 100 - What is the name of the t-test that Robostat

---

produces? The name of the t-test that Robostat produces is depending of the distribution of the data. - What are the decimal values for the t-tests? The decimal values for the t-tests are 3.97, 3.28, 2.88, 2.50 - What is the t-test? The t-test is a statistical test to check if a sample is normally

---

distributed. If the sample is normally distributed, a t-test provides a way to test whether the averages of two groups are the same.

- Does Robostat calculate the p-value? Robostat calculates the p-value directly, therefore no need to use excel. - What is the sample size to conclude that the

---

samples are  
different? The  
sample size to  
conclude that the  
samples are  
different must be  
less than 4. - What  
are the sample sizes  
for the t-test?  
There are no rules.  
- When do I use the  
Welch's t-test? The  
Welch's t-test is  
used to calculate  
the difference  
between the means

time performing statistical tests. Just enter the name, mean, standard deviation, sample size, name of the dependent value and p-value and you are done. You will notice that the program places an HTML copy of the results in the folder. Features: Can enter values with a text editor.

- [All] type of data (numeric, categorical, ordinal and double values) - [Common] this tool has been used to test the difference between means of different types of variables (corrected and not corrected, paired and not paired, cohort and not cohort), correlation between continuous

---

variables,  
correlation between  
categorical  
variables,  
correlation between  
ordinal variables,  
etc. - [Difference]  
these tests  
represent the  
difference between  
two or more samples  
but no information  
regarding the  
significance of this  
differences are  
shown. - [Pearson]

---

these tests are used to study the relationship between two variables and test for normality and the presence of outliers. - [T-test] these tests are used to investigate the significance of the difference between two means (Independent sample, paired or unpaired). - [Sig] these tests are used to compare

---

two means, variances  
or standard  
deviations

(Independent sample,  
paired or unpaired).

- [Mann-Whitney]

these tests are used  
to investigate the  
difference between  
two or more medians.

- [Friedman] these  
tests are used to  
investigate the  
difference between  
two or more medians  
and compared to a

---

single median. -  
[Wilcoxon] these tests are used to investigate the difference between two or more medians and compared to a single median. -  
[Kolmogorov-Smirnov] these tests are used to investigate the difference between two distributions. -  
[Co-Data] these tests compare the degree of

---

association between two or more variables. The units of these analyses are the same as they are used for Pearson's product moment correlation.
