Go to Help - Activate for the trial and follow the steps for the activation. in San Juan. They call it "the Egg." It contains about 10 million pieces of eggshell, and it gets covered in an outer coat of paint. The building also has a series of jagged vertical protrusions that give it a look resembling the top of an egg. It's a gargantuan white structure that would be visible from the air for miles around. "If you can see something as big as this from space, you have to assume it's important," Pape said. Over the last 10 years, Pape and his colleagues have visited and surveyed more than 10,000 sites across the world. They've done most of their research in the Amazon, which has been the source of one of the greatest ecological deluges in human history. It was estimated that about 3 billion gallons of water fell from the sky every day for four years in Brazil in the late 1990s. Researchers and media reports estimate that it may have killed some 60,000 animals in the area. "It's not a surprise that the Amazon is the largest wetland system on the planet," said Pape, "because it's the largest rainforest, and rainforests receive more than 75 percent of the world's rain." That's important because a third of the planet's species live in those forests. The total area of the Amazon is more than twice the size of India. "And yet we know little about the population ecology and community structure of the rainforest," said Pape. "It's like trying to study an entire ocean without ever going near the shore." Pape uses a technique called pitfall traps, where he plants dozens of little traps on the forest floor. When he returns, he walks through the woods looking for the traps. When he finds them, he carefully lifts the plastic caps off the traps and observes what's living underneath. Pape also collects rainwater, using it to analyze for substances like nitrogen and phosphorus. "When the rain is heavy, we collect a lot of rainwater and then pour it into a bucket so we can analyze it," Pape said. Pape's team also constructs rain gauges. They dig rain-collection trenches about a foot wide and 2.5 feet deep, and then they bury the buckets into the ground until the buckets fill up. "When it rains, they fill up
