Molecular Biology of the Cell: Molecular Biology of the Cell: Molecular Biology of the Cell: Windows and GNU/Linux: How different executable and run order of programs. I am about to make a test whether Mac OS or GNU/Linux is better for me. The one software is the executable form of an open source application in Linux, others are in Windows. But I do not know how the run order of those programs differ. In Linux, the process is in the beginning and in the end of the terminal window. How about Windows? A: On Windows, just create a new simple console-based text editor. Add a simple test program and start the editor in DOS (Start > Run). A hello world program, so simple that nobody would claim that you don't understand C #include int main (void) { printf ("hello world "); return 0; } The editor should start immediately, if the Windows machine is turned on. Then press Enter. See where the editor stops, and how long it takes to get there. There are many factors that could influence the performance, including the operating system (Windows, Linux, MacOS?), the kernel (2.6, 3.4, 3.5?), and your hardware (dual-core, single-core?). But the most basic thing you need to understand is that if you look carefully, you'll find that Windows is much faster than Linux and even MacOS.
